TITLE: Interaction of macroscopic pores in a solid

PERIODICAL: Fizika tverdogo tela, v. 5, no. 3, 1963, 891-896

TEXT: The authors consider two relatively large pores close to one another and calculate the possible distortions of the stress and diffusion fields caused by their interaction, and assess the kinetics of the processes accompanying the approach of their centers. This was

experimentally studied with macroscopic pores $10^{-1} - 10^{-2}$ cm diam in artificial NaCl crystals grown by the Stokbarger method. Samples with suitable, close, pores of equal size were selected and studied under the microscope. The pores were healed by heating in an autoclave (argon $20-30 \text{ kg/cm}^2$, $700-750^\circ\text{C}$). The experimental results are plotted as $l/l_0 = f(d/d_0)$, where $l=L+2R$ is the distance between the pore centers and $d=2R$, the pore diameter. The experimental values lie on the theoretical

TITLE: Healing of isolated voids in a crystalline body by uniform pressure

SOURCE: Fizika tverdogo tela, v. 5, no. 8, 1963, 2219-2227

TOPIC TAGS: healing, void, crystal, pressure, kinetics, Na, Cl, creep, high temperature, elastic limit

ABSTRACT: Experimental studies have been made to trace the kinetics of healing isolated voids in single crystals of NaCl when the crystals are subjected to externally applied gas pressure under uniform compression. The observed kinetics are explained by increased gas pressure in the voids as a consequence of decreased volume of the voids. Calculations have been made for the kinetics of healing isolated voids within the framework of "Odqvist's scheme" (F. Odqvist, Acta Polytechnica, 2, 125, 1953). By comparing experimental and computed kinetic curves, the value of the elastic limit in a single crystal of NaCl has been determined for the region of pre-fusion temperatures. The value obtained,

Card 1/2

L 19163-63

7

$\sim 45-55 \text{ g/mm}^2$, is found to be near the value determined optically at room temperature by R. I. Garber and L. M. Polyakov (FTT, 2, 974, 1960). Other parameters determining the kinetics of healing voids agree with values obtained by direct experiments on high-temperature creep in single crystals by Ya. Ye. Geguzin, V. L. Rabets, and A. A. Cherny*shov (FTT, 5, 891, 1963). Orig. art. has: 8 figures and 19 formulas.

Vertical Circle at Ukrainian Observatory To Be Checked

The vertical circle of the Main Astronomical Observatory of the Academy of Sciences Ukrainian SSR will be used in the coming years for an absolute determination of the declinations of fundamental stars of catalogues FK3 and FKS3 (detailed report on the instrument in article by G. Struve, Publications of the Berlin-Babelsberg University Observatory, Vol 3, No 1, Berlin, 1919). This will necessitate a detailed investigation of the graduation errors of the graduated circle, since such an investigation has never been made.

This article discusses the choice of the most rational method for this investigation, which will involve a considerable work. A comparison of the corrections of the diameters expressed in degrees, obtained according to the complete and the abridged Bruns methods, convincingly shows that the abridged program will be sufficiently accurate and yet will reduced the number of measurements and the amount of final data processing considerably. TITLE:

Special features of producing large-diameter X18H12M2T
(Kh18N12M2T) steel tubes

PERIODICAL:

Stal', no. 6, 1962, 532 - 535

TEXT:

Kh18N12M2T steel tubes cannot be made with diameters larger than 219 mm owing to the high deformation resistance and low ductility of the steel and because no tube blanks with larger diameter are available in this grade. Therefore, a technology to produce large-diameter Kh18N12M2T steel tubes from hollow tube blanks produced by centrifugal casting was established. The steel for centrifugal castings was smelted in a medium-size basic arc furnace with partial oxidation. To ensure the required mechanical properties, and reduce the segregation of the alpha-phase and the amount of non-metallic inclusions, the ad-
ditions of Cr, Ni and Ti were within narrower limits than permitted by the stan-
dard, (Cr 16.0 - 16.8; Ni 12.0 - 14.0; Ti 0.30 - 0.55). The billets were

X

Card 1/3

Special features of...

S/133/62/000/006/005/015
A054/A127

produced in two sizes: 285 x 65 x 3,200 and 320 x 65 x 3,200 mm (after machining: 260 x 35 x 3,200 and 300 x 35 x 2,900 mm). The mechanical tests showed a strength of 45 - 50 kg/mm² and a relative elongation of 45 - 60%. After heating to 1,000 - 1,050°C and a holding time of 1 hour 15 min - 1 hour 25 min and subsequent air-cooling, the strength limit and yield point had not changed, relative elongation increased slightly, relative contraction considerably. The tests on rolling tubes from the centrifugal castings were carried out on a "350" automatic mill. Two versions were applied. Three tube blanks, 245 x 45 x 2,900 mm in size, were rolled on two piercing stands, while in the other version 265 x 35 x 2,900 mm billets were rolled only on one piercing stand prior to the automatic stand, (with mandrels, 236 mm in diameter in the first pass and 238 mm in the second). Better results were obtained with the second version: no cracks formed on the tube end, the surface was also improved and power consumption was lower. Therefore, in the industrial-scale tests only the second version (using one piercing stand) was applied. In these tests 273-mm diameter tubes were produced from 260 x 35 x 2,900 mm billets and 325-mm diameter tubes from 300 x 35 x 2,900 mm billets (with a machining allowance of + 3 mm). About 25% of the 273 x 15 mm tubes had to be rejected owing to scaling. Macrostructural tests

Card 2/3

Special features of...

S/133/62/000/006/005/015
A054/A127

showed that in the metal of the tube blanks rolled the alpha-phase content attained index values of 3.5 - 4.0, due to the unfavourable chrome-to-nickel ratio. Investigations into the macrostructure of the tube blanks revealed changes taking place in it upon piercing, on account of the stresses then arising. The total value of reduction of the tube wall on the piercing stand, when 265 x 35 mm billets are processed into 273 x 20 mm tube blanks, should amount to 44.1%. After such a deformation it can be expected that the development of defects is checked. The tests were carried out with the participation of V. A. Surzhikov, A. D. Kovalova, A. V. Tkachenko, N. S. Kirvalidze, D. V. Gladkikh, and A. T. Esaulov, Engineers, (Yuzhnotrubnyy zavod-Yuzhnotrubnyy Plant). There are 6 figures.

AUTHOR: Burlakova, Ye. B.; Dzyuba, N. M.; Pal'mina, N. P.; Emanuel', N. M. (Corresponding member AN SSSR)

TITLE: Antioxidant activity of mouse liver lipids in radiation sickness and leukosis and the effect of free radical reaction inhibitors

SOURCE: AN SSSR. Doklady, v. 163, no. 5, 1965, 1278-1281

TOPIC TAGS: experiment animal, radiation sickness, radioprotective agent, liver, chemotherapy, oxidation inhibition, neoplasm

ABSTRACT: Based on the assumption that synthetic inhibitors might be effective in processes accompanied by changes in natural antioxidant activity, the antioxidant activity changes of liver lipids were studied after single or repeated administration of free radical reaction inhibitors to intact animals. Mice were injected intraperitoneally with the inhibitors dissolved in water or a 10% Tween-80 solution. The natural antioxidants were extracted from the lipid fraction of the animal livers and dissolved in methylolate, which

Card 1/3

L 2674-66

ACCESSION NR: AP5021291

was then oxidized in an air current at 36 C in an oxidizing chamber. The kinetics of antioxidant activity changes of lipid extracts following single introduction of 4-methyl-2,6-di-tert-butylphenol is graphed. It was observed that a single administration increased the antioxidant activity while repeated administrations depressed this activity for some time depending on dose. It may be thus assumed that synthetic inhibitors resemble natural ones. Repeating this experiment with mice which had received a lethal radiation dose and whose antioxidant activity had declined to zero, it was found that with a 30 mg/kg dose of the above compound the activity level was maintained and 20-25% of the mice survived, while a 100 mg/kg dose had no such effect. Since cancer cells are known to differ from normal cells by the amount of antioxidants, tests were conducted in mice with leukosis who received the inhibitor 4-oxy-3,5-di-tert-butyl-alpha-methylbenzamine, which depressed and lengthened the initial activity of liver lipids. In animals irradiated prior to leukosis, the activity developed at a slower pace the higher the dose, resulting in increased survival times of up to 2 days. Similar results were obtained for animals whose antioxidant activity was depressed by administering large amounts of the inhibitor. It may thus be

Card 2/3

L 2674-66
ACCESSION NR: AP5021291

concluded that small inhibitor amounts which cannot decrease the antioxidant activity of liver lipids in the intact animal display a radioprotective effect and favor the development of transplanted cancer, while large amounts which can decrease this activity will aggravate radiation sickness but slow down leukosis development. B

TITLE: Synthetic inhibitors and natural antioxidants. Antioxidative activity of liver lipids of mice during irradiation and the radioprotective action of free radical reaction inhibitors

SOURCE: Biofizika, v. 11, no. 1, 1966, 54-57

TOPIC TAGS: mouse, radiation sickness, radiation biochemical effect, liver, oxidation inhibition, free radical, antiradiation drug

ABSTRACT: Antioxidative activity changes of liver lipids and radioprotective effects of synthetic and natural free radical action inhibitors were investigated in Balb line mice (18 to 22 g) irradiated with single 650 and 450 r doses (RUT-200-20-3 unit, 15 ma, Cu 0.5 mm filter, 40 to 50 r/min). Synthetic inhibitors (not described) were administered 15 to 30 min prior to irradiation. Extraction of liver lipids and determination of antioxidative activity were conducted according to methods described in earlier studies. Survival of animals

Card 1/3

L 04746-67

ACC NR: AP6016942

was based on a 30 day period. To determine whether liver lipids of intact animals contain certain properties common to synthetic inhibitors and to avoid the difficulties of in vivo experimentation, liver lipid extracts of intact mice were diluted with methyl oleate and gamma-irradiated (Co^{60} , 10 r) with and without oxygen. Findings indicate that with a 650 r dose antioxidative activity of liver lipids after 4 hrs is equal to zero, i.e., the extract does not retard methyl oleate oxidation. After 5 to 7 hrs the lipid extracts accelerated methyl oleate oxidation, i.e., the antioxidation values became negative. With a 450 r dose the decrease of antioxidative activity is considerably smaller. Survival of animals irradiated with a 650 r dose is increased by 20 to 25% with administration of the inhibitor 4-methyl-2,6-di-tert-butyl phenol in a 30 mg/kg dose. The same dose administered to control animals does not increase antioxidative activity. But, with the administration of a 100 mg/kg dose to animals irradiated with a 650 r dose, antioxidative activity is decreased and animals fail to survive. Thus, antioxidative activity of liver lipids decreases with the development of radiation sickness and the natural inhibitors are expended during their interaction with peroxide radicals RO_2 . Synthetic inhibitors of free radical processes administered in doses increasing the antioxidative activity of liver lipids produce a radioprotective effect. Change of antioxidative activity under the action of free radical inhibitors may explain to a

Card 2/3

L 04746-67

ACC NR: AP6016942

certain extent the extreme dependence of animal survival on inhibitor dose. Orig. art. has: 4 figures.

"Zhur Analit Khim" Vol VI, No 5, pp 273-275

Examn of effect of nonaq formic acid on strength of strong and weak bases showed that strength of weak bases in the acid increases so much that they can be titrated as strong bases with sufficient accuracy for analysis. Calcd dissoen constn of number of bases (including diethylamine, morphine, pyridine, aniline).

Orig Pub: Uch. zap. Khar'kovsk. un-t, 1956, 71, 261-262

Abstract: Study of the effect of addition of C_6H_6 to $HCOOH$ on strength of mineral acids, by the method of potentiometric titration; the experiments were carried out with a mixture of 10% $HCOOH$ and 90% C_6H_6 ; quinhydrone electrode used as indicator electrode and a saturated calomel electrode as the comparison electrode. $HClO_4$, toluene sulfonic acid (I) and H_2SO_4 were titrated at 70° with a solution of pyridine in C_6H_6 . In a mixture of $HCOOH$ and C_6H_6 the change of potential from acid to alkaline region is greater than in a medium of $HCOOH$ (190 and 74 mv, respectively, in the case of I). Amelioration of the conditions

TITLE: Determination of pharmaceutical preparations containing a carbonyl group by titration with nonaqueous solvents. Report 3. Analysis of cardiac glycosides

AOURCE: Meditsinskaya promyshlennost' SSSR, no. 7, 1965, 57-60

TOPIC TAGS: circulatory drug, quantitative analysis, chemical identification, analytic chemistry

ABSTRACT: Earlier controls of these preparations were conducted with inconvenient biological methods. A quantitative chemical method described in earlier publications was applied to glycosides containing an aldehyde group at C₁₀, in particular to cymarin, erysimin, semisynthetic and natural convallatoxin and Corelborin II (Helleborus glycoside). It consists in reacting the carbonyl group with hydroxylamine HCl, forming the corresponding oxime and binding the liberated HCl with diethylamine whose excess is titrated off with perchloric acid in me-

thanol in the presence of the thymol blue indicator. Chromatographic tests showed that the results agreed with data from biological analysis, but the results obtained by chemical analysis were more reproducible and more exact. The chemical analysis method is therefore recommended for both laboratory work and analysis of standards. The semisynthetic convallatoxin was prepared by V. T. Chernobay. Title : Some Properties of Autumn-Winter Plankton and Hydro-chemical Character of Tsimlyansk Reservoir in the First Year of its Existence.

Orig Pub: Tr. probl. i temat. soveshchaniy. Zool. in-t, AN SSSR, 1957, No 7, 165-169.

Abstract: Plankton dissimilarity was established for the three main stretches of water of the Tsimlyansk Reservoir. The plankton dynamics were studied in detail, the main feature of which at the time of study (November 1952, January and March 1953) was to increase the quantity of plankton while its quality decreased. A direct correlation was
